

PROJECT DELIVERABLES

Presentation on LeanChem Connect

Project deliverables — unified platform for CRM, product management, sales pipeline, stock, import procurement costing, and executive reporting. One connected system for LeanChem's chemical import and distribution operations.

Version June 2026 | blank-slate-dashboard

EXECUTIVE SUMMARY

One workspace, six connected modules

CRM: Customer profiles, interactions, intelligent assistance

PMS: Product catalog, technical data, vendors, pricing

SALES: Pipeline tracking, deal progression, win/loss metrics

STOCK: Multi-warehouse inventory ledger

TRADE & TRANSIT: Procurement and multi-stage import costing

REPORTS: Business intelligence, forecasting, secure export capabilities

Strategic goal: Single source of truth from first customer contact through deal progression, stock fulfillment, import economics, and leadership reporting.

WHY WE BUILT IT

Business problems solved

- Siloed data across sales, procurement, warehouse, and finance departments
 - Disconnected communication between customer relations and product deal tracking
 - Manual calculations for complex import costing (landed cost, customs, margin)
 - Weak pipeline visibility lacking historical tracking
-
- Open deals not programmatically compared against available warehouse stock
 - No cross-module reporting for executive leadership
 - Duplicated product data across multiple incompatible tools
 - Decisions being made without consolidated operational data

ARCHITECTURE

How the platform is structured

FRONTEND — React 18 + TypeScript + Vite

Single-page application providing a unified workspace for CRM, PMS, Sales, Stock, Trade & Transit, and Reports. Styled with Tailwind CSS; communicates via REST and Supabase client.

BACKEND — FastAPI (Python) on Vercel

High-performance REST API handling CRM, PMS, sales pipeline, stock, integrated reports, and AI services — cross-module business logic and data orchestration.

DATA LAYER — Supabase (PostgreSQL + Auth + Storage)

Secure relational cloud database with row-level security, employee authentication, and file storage — structural integrity across customers, sales, inventory, and finance.

INTEGRATIONS

Google Gemini for AI (profiles, TDS extraction, summaries) · Supabase JWT and role-based access control (RBAC) for team access

MODULE DEEP-DIVE

CRM — Customer Relationship Management

Capabilities

- Centralized customer master data and automated onboarding flows
- Interaction timeline with file management and automated response drafting
- Intelligently generated customer profiles utilizing web research
- Dashboard tracking coverage metrics
- Secure external communication archive integration

Connections

- Automatically initializes pipeline deals for new customer accounts
- Interactions intrinsically link to pipeline data and technical product sheets
- Bulk synchronization engine advances and links deals systematically
- Global customer identifier shared seamlessly across stock and import finance modules

MODULE DEEP-DIVE

PMS — Product Management System

Capabilities

- Chemical master catalog featuring automated supplier grouping
- Technical document processing with automated data extraction
- Comprehensive market view including partners and partner chemicals
- Dynamic pricing and costing matrices by location
- Curated product shortlists

Product spine

A universal primary key strategy anchors the catalog and is utilized by:

- Sales pipeline transactions
- Import finance shipment tracking
- Inventory stock item linking
- Complex pricing junction datasets

MODULE DEEP-DIVE

Sales Pipeline

Per-customer, per-product deals with comprehensive version history auditing.

- Stage progression requires justification codes, creating a full audit trail
- Automated quotation generation configured for specific regional partners
- Live validation against primary distribution center availability
- Searchable and paginated deal repository
- Deal-level financial costing linked directly to the import calculator

MODULE DEEP-DIVE

Stock Management

Locations monitored: Primary Hub (Addis Ababa) · SEZ Operations (Kenya) · Regional Partner (Nairobi)

Strict ledger model

- Core movement ledger acts as the immutable source of truth
- All stock transitions strictly link to customer and pipeline identifiers
- Inter-company transfers enforce paired systemic movements to prevent discrepancies
- Integrated reporting engine automatically flags pipeline deals that exceed current availability

MODULE DEEP-DIVE

Trade & Transit — Import procurement

Automated 4-stage costing flow

Stage	What is calculated
Capital	Border capital outlay assessments (including parallel exchange metrics)
Customs	Automated computation of CIF, duty, scanning, social taxes, WHT, and VAT
Landed	Inland transportation factoring yielding net landed cost (ETB/kg)
Margin	Target price generation, profit per kg, gross margin percentage, and revenue projections

Output integrates directly into executive snapshots, syncs with PMS pricing, and generates transit summaries.

DATA MODEL

How datasets interconnect

- Customer records map bi-directionally to sales pipelines and interaction logs
- Product master data dictates categorical routing in the sales pipeline and import finance ledgers
- Sales pipelines act as the central nervous system, connecting pricing structures, interaction histories, and stock ledgers
- Stock inventories maintain strict relational integrity with the product master data and financial import records

END-TO-END

Typical business workflows

A — Customer to closed deal

System adds customer → auto-generates pipeline → logs interactions → advances stages → generates quotation → closes Won/Lost

B — Import procurement

Request initiated → multi-stage calculation executed → data snapshotted → transit summary generated → pushed to executive reporting

C — Fulfillment check

System analyzes open deal → compares required quantity against primary stock → triggers integrated risk report → logs paired stock movement upon fulfillment

D — Leadership reporting

Customer metrics + stock availability + pipeline forecasting aggregated into PDF-ready executive BI dashboards

MODULE DEEP-DIVE

Reports & Analysis

- Customer coverage and engagement volume metrics
 - Pipeline forecasting and conversion insights
 - Activity visualization charting
 - Algorithmic identification of dormant client accounts
 - Cross-module data snapshots
-
- Fulfillment risk analysis (demand vs. actual stock)
 - Trade transit and procurement summaries
 - Multi-deck executive reports analyzing product, customer, and foreign exchange impacts

DELIVERY STATUS

Key deliverables — achieved

Area	Deliverable	Status
Platform	Unified enterprise workspace, backend infrastructure, and database layer	Complete
CRM	Customer management, interaction tracking, automated syncs	Complete
PMS	Catalog structuring, automated document extraction, pricing grids	Complete
Sales	Version-controlled UI, pipeline progression, quotation engine	Complete
Stock	Multi-location ledger with pipeline validation	Complete
Finance	4-stage calculator and executive business intelligence	Complete
Reports	Integrated cross-module data structuring	Complete
Integration	Relational schema deployment, strict authentication protocols, and file storage APIs	Complete

OUTCOMES

Goals vs achievements

Goal	Result
One platform for operations	Deployed six dedicated workspaces within a single unified interface
Linked data ecosystems	Implemented strict unique identifiers to automate connections between customers, products, and deals
Import costing automation	Established database-persistent Trade & Transit module
Stock vs demand visibility	Automated fulfillment risk flagging within reports
Leadership dashboards	Delivered on-demand exportable CRM and executive intelligence overviews
Team access governance	Successfully configured enterprise authentication, role management, and credential security

Platform is live-ready.

ROADMAP

Run, integrate, and drive decisions with data

The build phase is complete. Focus shifts to adoption, meaningful reporting, and team-wide data-driven strategy.

PHASE 1 — LAUNCH & TRAIN

Put the platform in daily use

- **Finance:**
Implement Trade & Transit workflows, costing strategies, and executive reporting
- **Sales:**
Transition to platform-based CRM interactions, pipeline tracking, and quotation generation
- **Product managers:**
Shift to centralized catalog management and dynamic pricing

PHASE 2 — DATA-DRIVEN OPERATIONS

Turn collected data into action

- Automate regular, meaningful reports replacing legacy spreadsheets
- Establish review cadences utilizing live platform dashboards
- Proactively identify gaps, risks, and opportunities using strictly structured data

Success measure: Operations are exclusively executed within the Connect platform, and leadership decisions are definitively backed by integrated, cross-departmental data.
